

Automate Donor Check-In with Biometrics

Superior Security, Convenience and Speed with Just the Touch of a Finger

PRODUCT OVERVIEW

Positively identify blood donors while protecting their privacy and automating the check in process and donor identification. BIO-key's scalable, biometric-based identification solution can be integrated into your business applications to deliver superior speed, convenience and accuracy.

FEATURES

Streamline your donor check-in process

Biometric identification is fast and convenient for your donor. By accurately identifying donors without the need for them to produce identification or remember their donor ID numbers, you eliminate the time and errors associated with your staff validating identities and manually entering information into your system.

Protect Donor Privacy and Address Identity Theft Concerns

Address the privacy concerns of donors, by eliminating the need for them to produce less secure, less convenient identification forms such as, drivers licenses, donor ID cards or remembering a number. The donor simply places their finger on a fingerprint reader to quickly establish their identity. Donor identity is further secured since the fingerprint templates created to establish the identity of the donor are encrypted and cannot be reverse-engineered to re-create the fingerprint, ensuring the highest level of security.

Positive Donor Identification

The BIO-key automated donor check in process virtually eliminates the potential of accidental or intentional duplicate donor IDs. This cost effective solution reduces the risk of misidentification of donors and ensures against unnecessary and costly processing of deferrals.

Intuitive User Interface

BIO-key enrollment and Identification methods are respected as the easiest to use in the industry. For example, the enrollment wizard provides real-time user feedback on finger position, instructing the user what action to take in the event a finger is not correctly placed on the reader.

Enrolling and Identifying users is fast and easy!

BIO-key offers complete reader interoperability, supporting devices from every major fingerprint reader manufacturer. With this capability, users ENROLL ONCE on any BIO-key supported readers and simply present their finger to any other supported readers to establish identity. BIO-key supported fingerprint readers include all of the integrated readers being offered by all major tablet, laptop and PC manufacturers.

Key Benefits

Fast, Secure Identification

Protects donor privacy

Improves inventory accuracy

Reduces risk of misidentification

Eliminates potential for donors to register under multiple identities

Streamlines donor check-in, eliminating data entry errors

Donor ID information is secure, no fingerprints are stored

Superior Technology

- *Superior accuracy delivers fast, 'one to many' matching*
- *Integrates seamlessly with existing blood management systems*
- *Simple, secure web-based deployment model*
- *Supports all Major Fingerprint reader manufacturers– for Interchangeable Fingerprint Reader Interoperability*
